No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                              3 , Search time 16.2 Seconds (without alignments) 57.362 Million cell updates/sec

Patent No. 6548636
GENERAL INFORMATION:
APPLICANT: Dragic, Tatjana
APPLICANT: Olson, William
TITLE OF INVENTION: SULFATED CCR5 PEPTIDES FOR HIV-1 INFECTION
FILE REFERENCE: 2048/61010/JPW/SHS
CURRENT APPLICATION NUMBER: US/09/796,202
CURRENT FILING DATE: 2001-02-28
NUMBER OF SEQ ID NOS: 17
SOFTWARE: Patentin version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100.0%; Score 96; DB 4; Length 352; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 3022, Application US/09540236

Patent No. 6673910
GENERAL INFORMATION:
APPLICANT: GATY L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO MORAXELLA CATAR
TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS
TITLE REFERENCE: 2709, 2005-001
CURRENT APPLICATION NUMBER: US/09/540, 236
CURRENT FILING DATE: 2000-04-04
NUMBER OF SEQ ID NOS: 3840
NUMBER OF SEQ ID NOS: 3840
LENGTH: 727
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 6593, Application US/09328352
Patent No. 6562588
Patent No. 6562586
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BADVANNI FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04

Patent No. 6586185

GENERAL INFORMATION:
APPLICANT:
APPLICANT: Wolf, Eckard
APPLICANT: Regenbeen, Johannes
TITLE OF INVENTION: the Jagnosis or Treatment of Skin Disorders and Wound
TITLE OF INVENTION: Active Substances
TITLE OF INVENTION: Active Substances
FILE REFERENCE: 50125/014002
CURRENT APPLICATION NUMBER: US/09/886,319A
CURRENT FILING DATE: 2001-06-20
PRIOR APPLICATION NUMBER: US 60/222,081
PRIOR APPLICATION NUMBER: DE 10030149.5
PRIOR PILING DATE: 2000-06-20
PRIOR FILING DATE: 2000-06-20
PRIOR PILING DATE: 2000-06-20
PRIOR PILING DATE: 2000-06-20

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is an inactive human CC (Cys-Cys) chemokine receptor C CCRS), which is not a receptor of human immundeficiency virus type 1 or type 2 (HIV-1 or HIV-2). CCRS or its CDNA can used to diagnose, treat and/or prevent inflammatory diseases, e.g. rheumatoid arthritis, glomerulonephritis, asthma, idiopathic pulmonary fibrosis and psoriasis, viral infections, especially HIV-1 or HIV-2 infection, cancer, atherosclerosis and autoimmune disorders. Subjects that express the inactive receptor have a predisposition, or resistance to HIV-1 and/or

CCR5 or its cDNA can used to diagnose, treat and/or prevent inflammatory diseases, e.g. rheumatoid arthritis, glomerulonephritis, asthma, idiopathic pulmonary fibrosis and psoriasis, viral infections, especially human immunodeficiency virus type 1 or type 2 (HIV-1) infection, cancer, atherosclerosis and autoimmune disorders. Subjects that express the inactive receptor have a predisposition, or resistance to HIV-1 and/or HIV-2
                                                Inactive; human Cys-Cys chemokine receptor 5; CCR5; human immunodeficiency virus; type 1; type 2; HIV-1; HIV-2; predisposition; resistance; diagnosis; treatment; prevention; inflammatory disease; theumatorid arthritis; glomerulonephritis; asthma; idiopathic pulmonary fibrosis; psoriasis; viral infection; cancer; atherosclerosis; autoimmune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

```
This is the amino acid sequence of a CCR5 variant protein, designated CCR5-delta12, that includes the first 4 transmembrane domains of wild-type CCR5 (see AAW88121), but lacks transmembrane domains of wild-type CCR5 (see AAW88122), but lacks transmembrane domains 5-7. CCR5 serves as a co-receptor for infection by macrophage-tropic (M-tropic) are individuals homozygous for the CCR5-delta23 mutation are resistant to HIV-1 infection, but hererozygous individuals are susceptible. The invention additionally relates to the identification of variant CCR5mil (See AAW88211), which lacks transmembrane domains 3-7 of CCR5. The detection of CCR5 variants may be used to identify individuals at lower risk of infection relative to the general population who, if infected, may exhibit slower progression to AINS. Probes and primers (see AAW84127-36) are provided for use in diagnostic methods for detecting the presence of such variants. A method is provided for inhibiting HIV-1 infection of a cell expressing the CCR5 receptor. This involves introducing a nucleic acid encoding a CCR5 variant into the cell thereby references.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New CCR5 variant protein of the HIV-1 co-receptor - useful in developing resistance of CCR5-expressing cells to HIV-1 infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Quillent C, Arenzana Siesdedos F, Braun J;

New isolated NOVX polypeptides and nucleic acid molecules useful for treating, preventing and diagnosing pathological conditions with NOVX-associated disorders, such as cancer, obesity, diabetes and inflammatory or CNS diseases.

Claim 1; SEQ ID NO 162; 772pp; English.

The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide comprising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetees, obesity, and endocrine, CNS and inflammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing

The NOVX polypeptide comprising one or reating or preventing a pathology associated with the polypeptide e.g. disorders associated with abservant expression or activity of the polypeptide, such as cancer, diabetes, obssity, and endocrine, CNS and inflammatory disorders. They can also be used in any arious detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to one of the polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mammalian mixed lymphocyte receptor; chemokine receptor; MMLR-CCR; human; monocyte; macrophage; chemotaxis; haematopoiesis; infection; inflammation; proliferative disease; cardiovascular disease; tumour; rheumatoid arthritis; alveolitis; atherosclerosis; chronic granulomatous disease; asthma; myasthenia gravis; diabetes; chronic granulomatous disease; asthma; myasthenia gravis; diabetes; inflammatory bowel disease; toxic shock syndrome; septic shock;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated NOVX polypeptides and nucleic acid molecules useful for treating, preventing and diagnosing pathological conditions with NOVX-associated disorders, such as cancer, obesity, diabetes and inflammatory

This protein comprises human MMLR-CCR, a novel C-C chemokine receptor associated with monocyte/macrophage infiltration and chemotaxis and haematopoiesis. The amino acid sequence was deduced from a cDNA clone (see AAT99542) obtained from a cDNA library made from a cDNA clone collected on day 2 of a mixed lymphocyte culture, i.e. cells associated with inflammation and immunomdulation. Another novel chemokine receptor, MPHG-CCR (see AAN36767), is also claimed. MMLR-CCR contains 7 transmembrane spanning segments connected by a serives of intracellular and extracellular loops. MMLR-CCR and MPHG-CCR can be used to study, diagnose and treat disease states in which normal leukocyte function is perturbed by normal leukopoiesis or inappropriate activation via proliferative disease, tumourigenesis, autoimmune disease, abnormal proliferative, solid tumours, cardiovascular disease, abnormal cell proliferation, solid tumours, cardiovascular disease, abnormal cell arthritis, alveolitis, atherosclerosis, chronic granulomatous disease, asthma, myasthenia gravis, diabetes, inflammatory bowel disease, toxic shock syndrome, septic shock and Chediak-Higashi syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0
                                                                                                                                                                                                                                                       Polynucleotide encoding MMLR-CCR or MPHG-CCR chemokine receptor - useful to study, diagnose and treat, e.g. infection, inflammation, solid tumour and proliferative and cardiovascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human Cys-Cys chemokine receptor 5; CCR5; human immunodeficiency virus; type 1; type 2; HIV-1; HIV-2; diagnosis; treatment; prevention; inflammatory disease; rheumatoid arthritis; glomerulonephritis; asthma; idiopathic pulmonary fibrosis; psoriasis; viral infection; cancer; atherosclerosis; autoimmune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Chemokine receptor 88C; atherosclerosis; rheumatoid arthritis; tumour; asthma; viral infection, AIDS; inflammation; autoimmune disease; therapy; diagnosis; leukocyte trafficking; G protein coupled receptor; ligand; modulator; antibody; human.
                                                                                                                                                                                                                           The present sequence is human CC (Cys-Cys) chemokine receptor 5 (CCR5), which is stimulated by MIP-1 alpha, MIP-1 beta or RAWTES chemokines, but not by monocyte chemoattractant protein 1 (MCP-1), MCP-2, MCP-3, MCP-3, interleukin-6 (IL-8) or growth related gene product alpha (GRO alpha) chemokines. Active CGR-5 is also a receptor of human immundeficiency virus type 1 or type 2 (HIV-1 or HIV-2). CGR5 or its cDNA can used to diagnose, treat and/or prevent inflammatory diseases, e.g. rheumatoid psoriasis, glomerulonephritis, asthma, idiopathic pulmonary fibrosis and atherosclerosis and autoimmune disorders
                                                                                                                                           Active and inactive forms of human CC chemokine receptor CCR-5 - useful to diagnose, prevent and/or treat inflammatory disorders, autoimmune disease and viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

This polypeptide sequence comprises macaque chemokine receptor 88C, a G protein coupled receptor that is involved in laukocyte trafficking. Its amnion sequence in the from a 88C DNA (AATS163) isolated by PCR amplification. It shows 97% identity to human 88C (AAM27123). 88C receptors and their polypeptide fragments can be produced in transformed host cells. The receptors of peptides comprising one or more of the extracellular or intracellular domains, and anti-receptor antibodies can be used to modulate receptor activities, particularly ligand and G protein binding, and are potentially potentially useful in the treatment of atheroslerosis, rheumatoid arthritis, tumours, asthma, viral infection, AIDS, inflammatory conditions, pathological immune response, antibody that specifically binds to macaque 88C is claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            G-protein chemokine receptor; HDGNR10; signal transduction; haematopoiesis; leukaemia; inflammation; rheumatoid arthritis; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human G-protein chemokine receptor, HDGNR10 - useful to identify (ant)agonists, for treatment of haematopoiesis, leukaemia, chronic and acute inflammation, rheumatoid arthritis, etc.
                                                                                                                                                        New nucleic acid encoding chemokine receptors 88-2B and 88C - used modulate leukocyte trafficking, e.g. for treatment of inflammation, tumours, viral infections, auto-immune diseases, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    100.0%; Score 126; DB 2; Length 352; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This polypeptide sequence comprises novel human chemokine receptor 88C, a givetein coupled receptor that is involved in leukocyte trafficking. Its amino sequence was deduced from a cDNA clone (AAT851G) isolated from a macrophage library. It shows 62% identity to CCCKR1. Chemokine receptor 89.2B (see AAW27124) has also been identified. 88C and 88.2B receptors and their polypeptide fragments can be produced in transformed host cells. The receptors, peptides comprising one or more of the extracellular or intracellular domains, and anti-receptor antibodies can be used to modulate receptor activities, particularly ligand and G protein binding, and are potentially potentially useful in the treatment of atheroslerosis, rheumatoid arthritis, tumours, asthma, viral infection, AIDS, inflammatory conditions, pathological immune response, abnormal haematopoietic processes etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chemokine receptor 88C; atherosclerosis; rheumatoid arthritis; tumour; asthma; viral infection; AIDS; inflammation; autoimmune disease; therapy; diagnosis; leukocyte trafficking; G protein coupled receptor; ligand; modulator; antibody.
                                                                                                                                                                                                                                                                                                                                                           New nucleic acid encoding chemokine receptors 88-2B and 88C - used to modulate leukocyte trafficking, e.g. for treatment of inflammation, tumours, viral infections, auto-immune diseases, etc.

                 Novel human mature G-protein chemokine receptor HDGNRIO (AAW07602) is a 7-transmembrane protein involved in signal transduction. Its amino acid sequence was deduced from a cDNA clone (AAT44042) isolated from a human monocyte library. Isolation of the cDNA allows prodn. of recombinant HDGNRIO in host, e.g. E. coli, COS or Sf9, cells. The recombinant sceptor can be used to identify agonists or antagonists of the receptor, such cpds. can be used to treat conditions related to the under- and over-expression of G-protein chemokine receptors

This protein sequence comprises of a novel human macrophage-selective CC demonkine receptor that has been designated CRS. The sequence was deduced from an isolated cDNA clone (see AAT76920). An Ala127teu variant (see W238340 of CCRS was also identified. The susceptibility of human macrophages to HTV infection depends on cell surface expression of CD4 and CCRS. CCRS is a member of the 7-transmembrane superfamily of G-protein coupled cell surface molecules. It plays an essential role in the membrane thaion step of infection by some HIV isolates. The establishment of stable, non-human cell lines and transgenic mammals having cells that occapress human CD4 and CCRS provides valuable tools for research of HIV infection. Antibodies that bind to CCRS. CCRS variants, and CCRS-binding agents capable of blocking membrane fusion between HIV and target cells represent potential anti-HIV therapeutics for macrophage tropic strains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TGT (Cys) in wild-type CCR5, TGA
                                                                                                             CC chemokine receptor 5 polypeptide - used to inhibit membrane fusion between HIV and a target cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Annual Lord and the defection by macrophage-tropic (M-tropic) strains of HIV-1. The invention relates to the identification of a CCR5 variant (see AAW8831), designated CCR5, but lacking transmembrane domains of wild-type CCR5, but lacking transmembrane domains of wild-type CCR5, but lacking transmembrane domains 3-7. The presence of the CCR5m303 variant with the wild type CCR5 allele shows a positive correlation with resistance to infection with M-tropic HIV-1 strains, and may indicate slower progression of the disease. The detection of CCR5 variants may be used to identify individuals at lower risk of infection relative to the general population who, if infected, may exhibit slower progression to AIDS. Probes and primers (see AAV84127-36) are provided for use in diagnostic methods for detecting the presence of such variants. A method is provided for inhibiting HIV-1 infection of a cell expressing the CCR5 receptor. This involves introducing a nucleic acid encoding a CCR5 variant into the cell, thereby reducing the number of functional CCR5 molecules present on the cell surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, G-protein coupled receptor; G-protein chemokine receptor; HDGNR10; diagnosis; haematopoiesis; wound healing; coagulation; anglogenesis; tumour; infection; leukaemia; psoriasis; allergy; T-cell mediated autoimmune disease; atherogenesis; anaphylaxis; inflammation; allergic reaction; silicosis; sarcoidosis; rarcoidosis; rheumatoid arthritis; hyper-eosinophilia syndrome.
                                                                                                                                                                     New CCR5 variant protein of the HIV-1 co-receptor - useful in developing resistance of CCR5-expressing cells to HIV-1 infection.
                                                                                                                                                                                                                                        This is the amino acid sequence of wild-type human CCR5, which serves as

The present sequence represents a human G-protein chemokine receptor
designated HDGNR10. HDGNR10 polynucleotides are useful in methods of
screening for compounds which bind to and either: (1) activate the
HDGNR10 polypepides caushing stimulation of hematopolesis, wound
compound infections, leukaemia, T-cell mediated autoimmune diseases,
chronic infections, leukaemia, T-cell mediated autoimmune diseases,
parasitic infections, psoriasis, and to stimulate growth factor activity,
or (2) inhibit activation of the HDGNR10 polypeptides which is useful for
preventing and/or treating allargy, atherogenesis, anaphylaxis,
malignancy, chronic and eaute inflammation, histamine and immunoglobulin
E-mediated allergic reactions, prostaglandin-independent fever, bone
(marrow failure, silicosis, sarcoidosis, rheumacoid arthritis shock and
hyper-eosinophilia syndrome. The polynucleotides are also useful for
diagnostic assays for detecting diseases related to mutations in the
nucleic acid sequences encoding the polypeptides are also useful for
polynucleotides are also useful for in vitro purposes related to
constitute tresearch, synthesis of DNA and manufacture of DNA vectors
                                                                                                                                                                                                                                                 Isolated nucleic acid encoding human G-protein chemokine receptor useful for diagnostic assays, scientific research and screening for compounds which bind to and activate or inhibit activation of the receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, receptor, DC-SIGN, dendritic cell, T lymphocyte, HIV, 9p120;

ö

An antibody for the treatment or prevention of HIV-infection comprises a gpl20 portion which binds to DC-SIGN or is exposed upon gpl20 binding of DC-SIGN due to concomitant conformational change.

The specification describes an antibody which is specific for an antigenic fragment of gp120. This antigenic fragment binds to DC-SIGN or conformational change. DC-SIGN de Concomitant to specification of DC-SIGN de Concomitant of DC-SIGN is a receptor that is specifically expressed on dendritic cells and facilitates infection of T lymphocytes with HIV. DC-SIGN is identical to a HIV-1 gp120-binding C-type lectin. DC with high affinity. The antibody of the invention inhibits the trans enhancement of HIV entry into a T cell or macrophage facilitated by infection. The present sequence represents a human CCRS protein, which is a translocation promoting agent that interacts with CD4. This receptor functions in HIV-1 entry into cells

Isolated nucleic acid encoding a human G-protein chemokine receptor (CCR5) HDGNR10 polypeptide, useful for preventing or treating autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders and neurodegenerative disorders.

Example 40; Page 504-505; 518pp; English.

The invention relates to human G-protein chemokine receptor (CCRS)
HDGNR10 polypeptides and polynucleotides. CCRS HDGNR10 antibodies are
useful for treating, preventing or ameliorating a disease or disorder
associated with inflammation, defective or aberrant chemotaxis of immune
cells, HIV infection (such as Pheumocystis carini pneumonia or Kaposi's
sarcoma) or defective or aberrant T-cell antigen presenting cell
interaction. The disease or disorder may also be an infectious disease
(e.g. a viral infection such as an early stage HIV infection, a
cytomegalovirus infection, or a poxvirus infection, an autoimmune
disease (e.g. rheumatoid arthritis) or a neurodegenerative disorder. The
disease or disorder may be associated with aberrant CCRS expression, lack
of CCRS function, aberrant CCRS ligand expression, or lack of CCRS ligand
function. CCRS HOGNR10 protein is used as a food additive or preservative
to increase or decrease storage capabilities. CCRS HDGNR10 DNA are useful
for thomosome identification and in gene therapy. CCRS HDGNR10 DNA,
protein, antibodise, agonists and antagonists are also useful in the
diagnosis, treatment and prevention of cancer (breast, overy, adrenal gland, bone, bone marrow, gastrointestinal tract, liver, lung, urogenital); immune disorders (Addison's disease, allergies, autoimmune 

ö haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rhewmatoid arthritis and ulcerative colitis); cardiovascular disorders (myocardial ischaemias) and wound healing. Diagnostic agent containing two or more receptor-specific ligands, useful for detecting tumors, inflammation etc., also therapeutic use of ligand inhibitors.

Disclosure; Page 10; 26pp; German.

This invention describes a novel diagnostic agent (A) comprising at least two different ligands (I) for receptors (II) that are implicated in diseases. (A) are used for the diagnosis of tumors (especially colorectal or prostatic), organ rejection, inflammation and autoimmune diseases. Also inflammation (particularly bronchial asthma or chronic bowel inflammation), or autoimmune diseases (theumatoid arthritis or lupus), where the (cardio) vascular, lymphatic, respiratory, nerrous, digestive, andocrine, motor or urogenital systems or skin are affected, and bone marrow diseases. The products of the invention are chemokine derivatives immunosuppressive, dermatological, antitheumatic, antiarthritic. Chemokines act on specific tumor and inflammatory cells through a consideration of chemokine receptors (CR), which control migration and proliferation of these cells. Aka80128 represent human chemokine fragments used to illustrate the method of the invention

The invention is useful for identifying drugs or antibodies that interfere with the translocation of HIV into transformed mammalian cell or for identifying a human chemokine receptor that facilitates the infection of a particular HIV strain into the transformed mammalian cell. Compounds identified can be used to treat cellular dysfunction and to prevent or combat HIV infection. The present sequence is a human chemokine receptor (CTR), CC-CTR-5 related protein. CC-CTR-5 is the principal cofactor for entry mediated by the envelope glycoproteins of primary macrophage-tropic strains of HIV-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Transformed mammalian cell (I) that contains a CD4 gene, reporter gene and HIV LTR for identification of drugs and antibodies for treatment of

                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is human G-protein chemokine receptor (CCR5) HDGNR10 protein. CCR5 HDGNR10 cDNA is included in ATCC Deposit No: 97183. CCR5 HDGNR10 antibodies are useful for treating, preventing or ameliorating a disease or disorder associated with inflammation, defective or aberrant chemotaxis of immune cells, HIV infection (such as Pheumocystis carinii presenting cell interaction. The disease or disorder may also be an infections disease (e.g. a viral infection such as an early stage HIV infections disease (e.g. a viral infection, or a poxyirus infection, autoimmune disease (e.g. rheumatoid arthritis) or a neurodegenerative disorder. The disease or disorder may be associated with aberrant CCR5 ingand expression, or a cxy or CCR5 function, aberrant CCR5 ligand expression, or a care of CCR5 indand function. CCR5 HOGNR10 protein is used as a food additive or preservative to increase or decrease storage capabilities. CCR5 HOGNR10 DNA are useful for chromosome identification and in genee

The present sequence is human G-protein chemokine receptor (CCRS) HDGNR10 protein. CCRS HDGNR10 antibodies are useful for treating, preventing or ameliotating a disease or disorder associated with inflammation, defective or aberrant chemotaxis of immune cells, HIV infection (such as perman) and control or Kapposi, sarcoma) or defective or aberrant antigen presenting cell interaction. The disease or disorder may also be an infection, a cytomegalovirus infection such as mearly stage HIV infection, a cytomegalovirus infection or a neurodegenerative disorder. The disease or disorder may be associated with aberrant CCRS expression, lack of CCRS function, aberrant CRS expression, and of CCRS ligand function. CRS HGNR10 protein is used as a food additive or preservative to increase or decrease storage capabilities. CRS HIGNR10 protein, antibodies, agonists and antagonists are also useful in the diagnosis, antibodies, agonists and antagonists are also useful in the diagnosis, creatment and prevention of cancer (breast, ovary, adrenal gland, bone, bone marrow, gastrointestinal tract, liver, lung, urogenital); immune disorders (Addison's disease, allergies, autoimmune thempolytic anaemia, autoimmune thyroiditis, diabetes mellitus (crohu's disease, multiple sclerosis, rheumatoid arrhritts and ulcerative colitis); cardiovascular disorders (myocardial ischaemias) and wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated nucleic acid encoding a human G-protein chemokine receptor (CCRS) HDGNR10 polypeptide, useful for preventing or treating autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders and

Human; G protein-coupled receptor; GPCR; non-endogenous; mutant; constitutively activated GPCR; agonist; disease.

Non-endogenous human GPCR protein, SEQ ID NO: 477

18-FEB-2002 (first entry)

```
This invention describes a novel receptor polypeptide (I) selected from (i) a fully defined 329 amino acid sequence (II) fully disclosed in the specification; and (ii) a polypeptide encoded by the CDNA concained in a plasmid, and fragments, analogs and derivatives of the polypeptide. The products of the invention have antiinflammatory, immunomodulatory, antiparastic, antiparaptic, immunompressive, vulnerary, cytostatic, antiparastic, antiparatic, inferein chemokine activity and can be used for gene therapy. The G-protein chemokine also be used for stimulating sematopolesis, wound healing, coagulation, also be used for stimulating nematopolesis, parastic infections, psoriasis, and suffered autoimmune diseases, parastic infections, psoriasis, and mundal mundal sematory, antiparatic infertions, prostaglandin-independent fever, bone marrow failure, estimulating syndrome. Claim 1; Page 277-278; 394pp; English.

of GPCRB.

The invention relates to G protein-coupled receptors (GPCRs) for which the endogenous ligand has been identified. Non-endogenous constitutively activated versions of known GPCRs are used in the invention for the direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists. Such agonists are useful as therapeutic agents for diseases or disorders associated with GPCRs. The present sequence is a non-endogenous version of a known human GPCRs.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents the human CCR5 protein sequence. The invention relates to a method for determining whether an agent is capable of modulating the interaction of chemother receptor 5 (CCR5) with gpl20, comprising incubating the agent with GCR5 and gpl20 and determining whether the agent modulates the interaction, where gpl20 is associated with CDP4, and where the interaction is a low affinity binding. The method is used to identify an agent capable of modulating the method is used to identify an agent capable of modulating the interaction of CCR5 with gpl20. An agent identified by the method is used to operate composition for the treatment of a disease or condition associated with CCR5 and gpl20 interaction, to treat a subject with a disease or condition associated with CCR5 and gpl20 interaction, and for preparing a pharmaceutical for treating human immunodeficiency, virus (HIV). It can also be treat anti-inflammatory diseases. The method is commercially useful, amenable to high throughput screening, and is commercially useful, amenable to high throughput screening, and

The present sequence is that of human HIV-1 co-receptor CCR5. Amino acids 2-18 in the N-terminal region of CCR5 comprise an HIV-1 gpl20-binding 2-18 in the CRF and HIV-1 gpl20. Post-translational sulfation of the tyrosine regidues in the HIV-1 gpl20. Post-translational sulfation of the tyrosine regidues in the CCR5 N-terminus is required for gpl20 binding and may critically modulate the susceptibility of target cells to HIV-1 infection in vivo. The invention provides claimed sulfated peptides (see AABS294) that are invention provides claimed sulfated peptides (see AABS294) that are based on the CCR5 N-terminal region and which are effective for inhibiting HIV-1 binding to CCR5. These peptides are used in claimed methods of inhibiting HIV-1 infection of CD4+ cells, of preventing CD4+ cells are infected with HIV, of treating a subject whose CD4+ cells are infected with HIV, and of identifying an agent which inhibits binding of a CCR5 ligand to a CCR5 receptor. The methods may be carried out in a subject, appecially a human, infected (therapeutic method), not infected with HIV (prophylactic method), or in a subject who is not infected with, but has been exposed to, HIV
Novel compounds comprising specific amino acids within CCR5 (HIV 1 coreceptor) amino terminal domain including negatively charged and two sulfated tyrosine residues is useful for treating HIV infection in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention relates to the isolation of a novel human G-protein chemokine receptor (CCR5) designated HDGNR10, and polynucleotide sequences encoding it. The invention also describes antibodies that bind human G-protein chemokine receptor (CCR5) HDGNR10 and polynucleotide that bind human G-protein chemokine receptor (CCR5) HDGNR10 and polynucleotide sequences encoding the antibodies. The antibodies are useful for treating or preventing inflammation, defective or aberrant chemotaxis of immune cells and T-cell/antigen-presenting cell interactions, infections and autoimmune diseases, rheumatoid arthritis, neurodegeneration, viral infections (sepecially early-stage human immune deficiency virus (HIV), cytomegalovirus or pox virus infections, Kaposi sarcoma, or conditions associated with aberrant or deficient expression of the CCR5 receptor or its ligands. The antibodies are also useful to determine CCR5 expression, e.g. for diagnosis, prognosis and monitoring of cancer and other hyperproliferative diseases. The polynucleotide sequences encoding human G-protein chemokine receptor, (CCR5) HDGNR10 can be used to produce the recombinant receptor, and in the treatment of a wide range of diseases such as infectious diseases (e.g. hDGNR10 at the ceptor (CCR5) HDGNR10 at the ceptor (CCR5) HDGNR10 at the ceptor (CCR5).

HDGNR10 #1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

The present invention relates to the isolation of a novel human G-protein chemokine receptor (CCRS) designated HDGMR10, and polynucleotide chemokine receptor (CCRS) designated HDGMR10 and polynucleotide human G-protein chemokine receptor (CCRS) HDGMR10 and polynucleotide human G-protein chemokine receptor (CCRS) HDGMR10 and polynucleotide sequences encoding the antibodies. The antibodies are useful for treating or preventing inflammation, defective or aberrant chemotaxis of immune cells and T-cell/antigen-presenting cell interactions, infections and autofendmune defeases, rheumathoid architis, meurodegeneration, viral infections (especially early-stage human immune deficiency virus (HIV), cytomegalovirus or pox virus infections, Kaposi sarcoma, or conditions associated with aberrant or deficient expression of the CCRS receptor or its ligands. The antibodies are also useful to determine CCRS expression, e.g. for diagnosis, prognosis and monitoring of cancer and other prepreditive and in the treatment of a wide range of diseases. The polynucleotide sequences encoding human G-protein chemokine receptor (CCRS) HDGMR10 can be used to produce the recombinant receptor, and in the treatment of a wide range of diseases cuch present sequence represents human G-protein chemokine receptor (CCRS) HDGMR10 can be used to grades (e.g. influenza), neurological diseases (e.g. present sequence represents human G-protein chemokine receptor (CCRS). The present sequence represents human G-protein chemokine receptor (CCRS) presents control control

New nucleic acid encoding an antibody specific for the G-protein chemokine receptor CCR5, useful for treatment and diagnosis of e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method for identifying a binding compound for CC Chemokine receptor 5 (CCR5). The method involves screening a library of test molecules (particularly peptides) with immobilised CCR5, and then identifying those molecules which bind. The invention also relates to CCR5-binding molecules identified using the method of the invention, methods for identifying consensus motifs for CCR5-binding peptides, a transfer vector encoding tagged CCR5, a computer-aided methods for determining the relative binding affinity of a test molecule to CCR5 and a computer aided drug screening assay that utilises the three-dimensional structure of CCR5. Compounds identified using the methods of the invention are useful for treating or preventing HIV (human immunodeficiency virus) infection or AIDS (acquired immunodeficiency syndrome) in a patient. The methods of the invention may also be used to identify agonists or antagonists of the interaction of CCR5. The present squence represents a naturally courting variant of human CCR5 in which there is a glutamine, rather than a leucine, at position 55
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CCR5; CC chemokine receptor 5; human; HIV infection;
human immunodeficiency virus; AIDS; acquired immunodeficiency syndrome;
drug screening; identification.
                                                                                                                                                                                 Identifying CC chemokine receptor 5 binding compound for treating AIDS, comprises binding a molecule from library to a molecule having binding property corresponding to CCR5 and identifying bound molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            100.0%; Score 126; DB 5; Length 352;

The invention relates to a method for identifying a binding compound for CC chemokine receptor 5 (CCR5). The method involves screening a library CC chemokine receptor 5 (CCR5). The method involves screening a library of test molecules (particularly peptides) with immobilised CCR5, and then classified those molecules which bind. The invention also relates to CCR5-binding molecules identified using the method of the invention. CC cross-binding molecules identified using the method of the invention. CC cross-binding peptides, a computer aided drug screening assay that utilises the three-dimensional a computer aided drug screening assay that utilises the three-dimensional corputation are useful for treating or preventing HTW (human invention are useful for treating or preventing HTW (human corputation) infection or AIDS (acquired immunodeficiency virus) infection or AIDS (acquired immunodeficiency syndrome) in a patient. The methods of the invention may also be used to alternal ligand, and to determine a binding motif for CCR5. The present acquired represents human CCR5 and became a binding motif for CCR5. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; G-protein chemokine receptor; HDGNR10; CCRS receptor; haematopoiesis; solid tumour; chronic infection; leukaemia; T-cell mediated autoimmune disease; parasitic infection; portassis; growth factor activity; allergy; parasitic infection; psortassis; growth factor activity; allergy; attherogenesis; anaphylaxis; mallignancy; inflammation; histamine; immunoglobulin E; IgE-mediated allergic reaction; sarcoidosis; prostaglandin-independent fever; bone marrow failure; shock; rheumatodia arthitis; hyper-eosinophilic syndrome; cytostatic; antiparastic; antiparastic; antiparastic; antiparastic; antiparastic; antitheumator; antiathritic; antiathritic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying CC chemokine receptor 5 binding compound for treating AIDS, comprises binding a molecule from library to a molecule having binding property corresponding to CCR5 and identifying bound molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention relates to the isolation of human G-protein chemokine receptor, HDGNR10 (CCRS receptor), and the polynucleotide sequence encoding it. HDGNR10 polypeptide and polynucleotide sequences are or useful for diagnosine of HDGNR10. They are useful for identifying related to underexpression of HDGNR10. They are useful for identifying modulators for stimulating haematopoiesis, wound healing, coagulation, angiogenesis, to treat solid tumours, chronic infections, psoriasis, or for stimulating growth factor activity. The sequences are also useful for preventing and/or treating allergy, atherogenesis, anaphylaxis, malignancy, chronic and acute inflammation, histamine and immunoglobulin E (IgE) -mediated allergic reactions, prostaglandin-independent fever, bone marrow failure, sarcoidosis, theumatoid arthritis, shock and hypersessing essents sequence represents human G-protein chemokine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel human G-protein chemokine receptor polypeptide useful for identifying modulators for stimulating hematopoiesis, wound healing, leukemia, for treating allergy, rheumatoid arthritis, shock and as

```
The invention describes an isolated polymucleotide encoding a first antibody at least 95-100% identical to a second antibody consisting of an antibody at least 95-100% identical to a second antibody consisting of a wariable heavy (WH) or variable light (NL) domain of the antibody conversable heavy (WH) or variable light (VL) domain of the antibody conversable heavy (WH) or variable light (VL) domain of the antibody conversable heavy (WH) or variable light (VL) domain of the antibody conversable heavy (WH) or variable light (VL) domain of the antibody conversable heavy (WH) or variable light (VL) domain of the antibody conversable heavily preventing, preventing, proposing of propositions are an attained, prognosing or monitoring concents or other diseases or disorders and ataxia telangiectusia, inflammation associated disorders such as endotoxin lethality, nephritis conditions proceed with an increase in certain heamatopoletic cells such as histocytosis, defective or aberrant chemotaxis of immune cells or T-cell antigen presenting cell interaction, confined disease, an autodimmune disease such as Addison's disease, dermatitis and rheumatoid arthritis, alleadies, a neurodegenerative disorder, a viral infection e.g. HIV infection, cytomegalovirus or cardiovascular disorders such as atherosolerosis, lymphocytopenias, or disease or disorder associated with aberrant expression of novel human Genote of human immunoglobulin sequence associated with the antibodies against HDGNRIO
                                                                                                                                                                                                                                                                                                                                                                                                 New human G-protein Chemokine Receptor gene (HDGNR10) useful for treating, preventing, ameliorating or monitoring diseases or disorders associated with aberrant expression of HDGNR10 e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 126; DB 5; Length 352;

US2002061834-A1.

23-MAY-2002.

Homo sapiens.

Human G-protein chemokine receptor (CCR5), HDGNR10 #1.

24-FEB-2003 (first entry)

AAE25808 standard; protein; 352 AA.

```
The invention describes an isolated polynuclectide encoding a first antibody at least 95-100% identical to a second antibody consisting of antibody at least 95-100% identical to a second antibody consisting of an anino acid sequence comprising at least one, two or three CDR regions of a variable heavy (VH) or variable light (VL) domain of the antibody consisting of XF3-57-57-58-1818.

CC expressed by a hybridoma cell line consisting of XF3-571, XF1.1F6, XF2/28.25G1, XF2/28.36A1, XF2/28.35F1, OFF1.1F6, XF2/28.35G1 or AF2/28.38F1 or XF2/28.38F2. The antibody is useful treating, preventing, ameliorating, prognosing or monitoring cancers or other diseases or disorders e.g. immunologic deficiency syndromes such as blood protein disorders and ataxia telanglectasia, inflammation associated disorders such as endoctoxin lethality, nephritis and inflammatory bowel disease, conditions associated with an increase in certain haematopoietic cells such as histiocytosis, defective or aberrant chemotaxis of immune cells or T-cell antigen presenting cell interaction, an infections disease, an autoimment disease such as Addison's disease, disorder an viral infection, eycomegalovitus or poxvirus infection, a Pneumocystis carnii infection, eycomegalovitus or poxvirus infection, a Pneumocystis carnii infection, kaposi's sarcoma, cardiovascular disorders such as atheroselerosis, lymphocytopenias, or a disorder associated with aberrant expression of novel human G-protein chemokine receptor (CCRS) HDGNRIO #1 and and or disorder receptor (CCRS) HDGNRIO #1 and and or disorder protein chemokine receptor (CCRS) HDGNRIO #1
                                                                                                 neurodegenerative disorder; viral infection; poxvirus infection; HIV;
human immunodeficiency virus; cytomegalovirus; Kaposi's sarcoma;
Pneumocystis carnii infection; cardiovascular disorder; atherosclerosis;
immunologic deficiency syndrome; blood protein disorder; nephritis; ataxia telangiectasia; endotoxin lethality; inflammatory bowel disease; histicoytosis; chemotaxis; infectious disease; autcimmune disease; Addison's disease; dermatitis; rheumatoid arthritis; allergy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New human G-protein Chemokine Receptor gene (HDGNR10) useful for treating, preventing, ameliorating or monitoring diseases or disorders associated with aberrant expression of HDGNR10 e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure, Fig 1A-B; 562pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Roschke V, Rosen CA, Ruben SM;

```
The invention relates to human G-protein chemokine receptor (CCR5), HDGNR10 proteins and nucleic acid molecules encoding such proteins. CCR5 antibodies are used for the treatment or prevention of inflammation, defective or aberrant chemotaxis of immune cells or T cell antigenpresenting cell interaction, viral infections (specifically human immune deficiency (including its early stages), cytomegalo or pox viruses), autoimmune disease, rheumatoid arthritis, neurodegeneration, Pneumocystis carinii infection, Raposi's sarcoma or any condition associated with aberrant expression of CCR5 or their ligands. They are also used for the detection, diagnosis, prognosis and monitoring of cancers or other hyperproliferative diseases. The present sequence is human G-protein chemokine receptor (CCR5), HDGNR10 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to human G-protein chemokine receptor (CCRS), this invention relates to human G-protein chemokine receptor (CCRS) antibodies are used for the treatment or prevention of inflammation, defective or aberrant chemotaxis of immune cells or T cell antigenpresenting cell interaction, viral infections (specifically human immune deficiency (including its early stages), cytomegalo or pox viruses), autoimmune disease, rheumatoid arthritis, neurodegeneration, Pneumocystis carinii infection, Kaposi's sarcoma or any condition associated with detection, diagnosis, prognosis and monitoring of cancers or other hyperproliferative diseases. The present sequence is human G-protein chemokine receptor (CCRS), HDGNR10 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid encoding antibodies to the human CCRS receptor HDGNR10, useful for treatment, prevention and diagnosis of e.g. cancer, also

                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel human 7-transmembrane receptor, HDGNR10, which has been identified as a G-protein chemokine receptor. The GPCR HDGNR10 polypeptide can be expressed by standard recombinant methodology. Compounds that activate or inhibit the receptor polypeptide, optionally expressed from DNA in gene therapy vectors, are used to treat diseases that require: (a) activation of the receptor (e.g. stimulation of haematcopoises, treatment of solid tumours, T-cell mediated autoimmune diseases, parasitic infections, psoriasis etc.); or (b) inhibition of the receptor (e.g. allergy, inflammation, rheumatoid arthritis, silicosis etc.). The present sequence represents the human HDGNR10 receptor
                                                                                                                                                                                                                                                                                    New polynucleotide encoding a human G protein chemokine receptor HDGNR10, useful e.g. for treating tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human chemokine C-C motif receptor 5, CCR5, haplotype pair; isogene; single nuclectide polymorphism; SNP; human immunddeficiancy virus 1; HIV-1 infection; acquired immunodeficiency syndrome; AIDS; antiviral; genotype; polymorphic variant; transgenic; drug screening; gene therapy;

The present sequence is that of a polypeptide encoded by the human chemokine (C-C motif) receptor 5 (CCR5) gene of the invention (see ABA97119, ABA97119). The specification describes haplotyping the CCR5 gene of an individual by determining if the individual has one of the CCR5 haplotypes or haplotype pairs fully defined in the specification. The specification also describes an isolated polymorlectide comprising a nucleotide sequence which is a polymorphic variant of the reference CCR5 gene sequence and comprises an isogene defined by a haplotype described in the specification and itse encoded polypeptide. The methods of the invention are useful to diagnose and develop treatment for diseases associated with abnormal expression or function of the gene. The CCR5 immunodeficiency virus (HIV)-1 infection and the progression to acquired immunodeficiency virus (HIV)-1 infection and the progression to acquired immunodeficiency virus (HIV)-1 infection and the progression to acquired individual; predicting a haplotype pair for the CCR5 gene of an individual; predicting an association between a trait and a haplotype or haplotype pair of the CCR5 gene. The specification describes a composition comprising a genotyping oligonucleotide for detecting a CCR5 polymorphism, a recombinant non-human organism transformed with CCR5 polymorphism, a recombinant non-human organism transformed with CCR5 polymorphism, a recombinant the CCR5 polypeptide and a method for screening drugs targeting the CCR5 polypeptide and a method for cereening drugs targeting the CCR5 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New haplotypes of the human chemokine (C-C motif) receptor 5 gene, useful to diagnose and treat diseases associated with its abnormal expression or function, including human immunodeficiency virus-1 infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, receptor; G-protein chemokine receptor; 7-transmembrane receptor; Human, signal transduction; gene therspy; hadmatopoissis; wound healing; coaqulation; angiogenesis; tumour; chronic infection; leukaemia; T-cell mediated auto-immune disease; parasitic infection; psoriasis; growth factor; allergy; athacroganesis; and mediated malignancy; inflammation; histemine; IGE-mediated; prostaglandin-independent fever; bone marrow failure; silicosis;

The invention discloses a G-protein chemokine receptor (sometimes referred to as a 7-transmembrane receptor) polypeptide, HDGNR10, and the polymuclectide encoding it. G-protein chemokine receptors are involved in signal transduction pathways. The polymuclectide and polypeptide can be used to identify compounds which activate or inhibit activation of the protein and these compounds are useful for treating a patient having need to activate or inhibit a G-protein chemokine receptor. The compound is administered by providing to the patient DNA encoding the agonist or antagonist and expressing them in vivo (gene therapy). The oplymuclectides and polypeptide are also useful for for disquasing of the protein, for chromosome identification or as immunogens for producing the protein, for chromosome identification or as immunogens for producing national elevations, andiogenesis, to treat solid tumours, chronic infections, leukaemia, T-cell mediated auto-immune diseases, parasitic infections, psoriasis and to stimulate growth factor activity. Antagonists are useful in the prevention and treatment of allergy, atherogenesis, anaphylaxis, malignancy, chronic and acute inflammation, histamine and IgS-mediated allergic reactions, prostaglandin-independent fever, bone marrow failure, sillogis, sarcoidosis, rheumatoid arthritis, human uncertices. The sequence presented is the the prevented of the prevented of the beaution and the prevented of the beaution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                         Novel human G-protein chemokine receptor polypeptide useful for diagnostic purposes and for identifying modulators of the polypeptide useful for treating leukemia, autoimmune diseases, psoriasis and allergic
sarcoidosis; rheumatoid arthritis; shock; hyper-eosinophilic syndrome.

The present invention describes an isolated nucleic acid molecule, which comprises the sequence of any of the genes that are up-regulated or down-regulated in specific cancers (e.g. about 1031 genes up-regulated in a require lukemia). ACC72641 to ACC72860 represent cancer related gene nucleotide sequences which encode the proteins given in ARR58709. Also described: (1) determining the presence or absence of a pathological cell in a patient; (2) an expression vector comprising a nucleic acid molecule described above; (3) a host cell comprising the vector; (4) an isolated polypeptide, which is encoded by the nucleic acid; (5) an antibody that specifically binds the polypeptide of (4); (6) specifically targeting a compound to a pathological cell in a patient by administering to the patient the antibody above; and (7) a drug screening assay. The nucleic acid is useful for therapeutic targets. In particular, the nucleic acid is useful for charapeutic targets. In particular, the nucleic acid is useful for bladder, brain, breast, cervix, colon/rectum, kidney, lung, ovary, pancreas, prostate, skin and uterus, wounds, ischaemia, heart diseases, athonic contracts and endometriosis. The nucleic acid is also useful in a bathology screening, pancrearing the reating these asthonic acid is also useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, urological disorder; stress urinary incontinence; prostate cancer; benign prostatic hyperplasia; overactive bladder;

The invention relates to a method for treating an urological disorder which comprises assaying the ability of the compound to modulate 313, 334, 5464, 188717 or 33524 nucleic acid expression or polypeptide activity. The method is useful for identifying a compound for treating an urological disorder comprising urinary incontinence e.g., overactive/oversensitive bladder, overflow urinary incontinence, stress urinary incontinence ansect by peripheral nervous system, prostatitis, benign prostatic hyperplasia, prostate cancer or kiney disorders. It is also used in gene therapy. The prostate cancer or kiney disorders. It is also used in gene therapy. The prostate the method of the invention protein. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                           Identifying a compound, capable of treating urological disorder e.g., benign prostatic hyperplasia, by assaying the ability of the compound to modulate 313, 333, 5464, 188717 or 33524 nucleic acid expression or polypeptide activity.
overflow urinary incontinence; gene therapy; nephrotropic; prostatitis; kidney disorder; C-C chemokine receptor type 5; CCR5; receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0

Producing an antibody, involves immunizing an animal with a polypeptide or with a polypeptide encoded by the human G-protein chemokine receptor clone in ATCC 97183, and recovering the antibody: Claim 1; Fig 1; 23pp; English.

The invention relates to a method of producing an antibody, involving immunishing an animal with a human G-protein chemokine receptor (HDGNR10) polypeptide (also referred to as a human 7-transmembrane receptor) and recovering an antibody which binds the polypeptide. The method is useful for producing an antibody which binds specifically to the human G-protein chemokine receptor polypeptide. This sequence represents the HDGNR10 polypeptide of the invention

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 2, Application US/08575967A
Patent No. 6265184
GENERAL INFORMATION:
APPLICANT: Gray et al.
TITLE OF INVENTION: Chemokine Receptor Materials and Methods
NUMBER OF SEQUENCES: 16
CORRESPONDENCE ADDRESS: 16
CORRESPENDENCE ADDRESSE: Marchall, O'Toole, Gerstein, Murray & Borun
STREET: 6300 Sears Tower, 233 S. Wacker Drive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match 100.0%; Score 126; DB 3; Length 352; Best Local Similarity 100.0%; Pred. No. 2.5e-11; Matches 22; Conservative 0; Mismatches 0; Indels (
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ZIE: 60606

MEDIUM TYPE: Floppy disk
COMPUTER: IBM FC Compatible
COMPUTER: IBM FC Compatible
COMPUTER: IBM FC COMPATIBLE
COMPATION: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.25 (EPO)
CURRENT APPLICATION DATA:
APPLICATION NUMBER: 33 (S) (8) (833,752
FILING DATE: 9-APR-1997
CLASSIFICATION: NUMBER: 34,115
REGISTRATION NUMBER: 34,115
REFERENCE/DOCKET NUMBER: 34,115
REFERENCE/COCKET NUMBER: 34,115
SEQUENCE CHARACTERISTICS:

'LENGTH: 352 amino acids

TYPE: amino acid

TOPOLOGY: linear

MOLECULE TYPE: peptide

FRAGMENT TYPE: internal

SEQUENCE DESCRIPTION: SEQ ID NO: 52:

Sequence 12, Application US/10084813

Publication No. US20030068615A1

GENERAL INFORMATION:

TITLE OF INVENTION: POLYPEPTIDES THAT BIND HIV GP120 AND RELATED NUCLEIC

TITLE OF INVENTION: ACIDS, ANTIBODIES, COMPOSITIONS, AND METHODS OF USE

TITLE OF INVENTION: ACIDS, ANTIBODIES, COMPOSITIONS, AND METHODS OF USE

CURRENT APPLICATION NUMBER: US/10/084,813

CURRENT APPLICATION NUMBER: DO2-27

PRIOR PILING DATE: 2000-08-25

PRIOR FILING DATE: 1999-08-27

PRIOR FILING DATE: 1999-08-27

NUMBER OF SEQ ID NOS: 1242

SEQ ID NO 12
